

Intermediate Report Grading Rubric

CS 789 - Software Reengineering

Milestone 2 | 50 points (15 team + 35 individual)

Team		Student	
------	--	---------	--

This milestone assesses actual reengineering progress, not planning alone. Each student must show substantive work on at least 4 of 7 assigned PRs, including at least one Category 4 PR. Team points are shared; individual points are assigned separately.

Team Component [15 points]

Criterion	Pts	Full-credit evidence	Score
Response to team-level Pre-conditions feedback	2.0	Team-level feedback is traceably addressed; actions and report locations are clear; unresolved items remain visible. Individual feedback is assessed in the student component.	
Updated project context and strategy	2.0	Team revises scope, workflow, Definition of Done, patterns/maxims, and assumptions based on what has been learned.	
Overall PR progress and synthesis	2.0	All assigned PRs remain visible in the status view and the team identifies meaningful progress, recurring issues, and current blockers.	
Use of lab techniques and tools	3.0	Across the team, meaningful evidence is drawn from the five lab areas; tools/techniques are selected for usefulness and their contribution is interpreted.	
Coordination and accountability	3.0	Weekly meetings/minutes and Discord show steady named progress, early blocker escalation, decisions, and next actions.	
Updated risk, effort, and plan to Final	2.0	Remaining work is realistically prioritized, exceptional cases are identified, and internal targets leave time for completion, validation, LLM-assisted work, synthesis, and revision.	
Report coherence and traceability	1.0	The report clearly builds on the Pre-conditions Report, keeps individual ownership visible, and presents evidence concisely and consistently.	
Team Component subtotal	15		

Individual Component [35 points]

Criterion	Pts	Full-credit evidence	Score
Response to individual feedback, if applicable	2.0	Student addresses feedback directed to their own earlier work and shows where the correction or strengthening appears. If no individual feedback was given, award these points based on appropriate carry-forward/revision of the student's earlier material.	

Criterion	Pts	Full-credit evidence	Score
Milestone progress across assigned PRs	5.0	Student shows substantive reengineering work on at least 4 of 7 PRs, including at least one Category 4; all seven PRs have a visible status and next step.	
Repository/change investigation	5.0	PR purpose, URL/commit, changed files, history, and other repository evidence are accurate and used to explain the change.	
Design recovery and source-target analysis	8.0	Student recovers relevant source and target designs, identifies the integration point and design/evolution gap, and uses diagrams or other evidence where useful.	
Integration, adaptation, and failure analysis	7.0	Cherry-pick/RePatch results are correctly analyzed; adaptations, refactorings, conflicts, or Category 4 barriers are explained with evidence rather than trial-and-error reporting.	
Testing and validation	5.0	Relevant tests are executed and interpreted; test adequacy is assessed; comparable coverage is used where appropriate and limitations are reported honestly.	
Reengineering reasoning and patterns	3.0	Student connects OORP patterns and relevant techniques to concrete decisions and states a defensible current outcome/lesson for each substantive PR.	
Individual Component subtotal	35		

Scoring guidance

Full credit requires technically sound, traceable, and appropriately explained evidence. Award partial credit in proportion to completeness and quality. Team points are shared; individual points are assigned separately. A technically unsuccessful integration or LLM experiment can earn full credit when the required process, verification, evidence, and analysis are complete and well reasoned.

Component	Maximum	Score
Team	15	
Individual	35	
Total	50
